

Capacitor Wall Bushing

Overview

According to IEEE/ANSI Std. an electrical bushing is defined as “an insulating structure, including a through conductor or providing a central passage for such a conductor, with provision for mounting a barrier, conducting or otherwise, for the purpose of insulating the conductor from the barrier and conducting current from. Simply we can say the purpose of an electrical bushing is to transmit electrical power in or out of enclosures, i.e., barriers, of an electrical apparatus such as transformers, circuit breakers, shunt reactors, and power. There are many methods to classify the types of bushings. These classifications are based on practical reasons, which will become apparent in the following discussion in three broad. As shown in the above section, bushings are classified into six types based on insulating media at the ends. Some of them are explained in this section. As we discussed above bushings are classified into to according to their construction. They are 1. Solid type (Bulk type) Bushings 2. Capacitance-graded (Condenser type) Bushings.
