Overview

A lithium-titanate battery is a modified lithium-ion battery that uses lithium-titanate nanocrystals, instead of carbon, on the surface of its anode. This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the. The lithium-titanate or lithium-titanium-oxide (LTO) battery is a type of which has the advantage of being faster to charge than other but the disadvantage is a much. Titanate batteries are used in certain Japanese-only versions of as well as 's EV-neo electric bike and. They are also used in the concept electric bus.
