

Rotating solar panels for sale

Overview

Ground mounted solar installations can use solar trackers to tilt the angle of solar panels throughout the day, maximising generation. They are typically used in large scale commercial or utility projects - not residential. With a static system, sunlight hits the panel at a varying angle - called the angle of incidence - throughout the day. The narrower the angle of incidence, the higher the output. So with a single axis system moves the panels through one range of motion. The axis is typically oriented north-south, so the solar panels can tilt east through west as the sun rises and sets. A. Let's compare the output of an optimised single axis tracking system to a fixed system in London (both 10kWp): As you can see, there is one point around midday when the static system's output is equal to the tracking system's. Overall, you can achieve an average output increase of 20-25% with a single axis tracker. With a dual axis tracker, expected increase is another 5-10% on top of that, but this rarely justifies the extra cost.
