

What are the lead-acid batteries with large energy storage capacity

Overview

Energy storage using batteries is accepted as one of the most important and efficient ways of stabilising electricity networks and there are a variety of different battery chemistries that may be used. Lead batteries are well established and are being used increasingly. The need for energy storage in electricity networks is becoming increasingly important as more generating capacity uses renewable energy sources which are intrinsically intermittent.

2.1. Lead-acid battery principles
 The overall discharge reaction in a lead-acid battery is: $\text{PbO}_2 + \text{Pb} + 2\text{H}_2\text{SO}_4 \rightarrow 2\text{PbSO}_4 + 2\text{H}_2\text{O}$
 The nominal cell voltage is 2.1V.

3.1. Positive grid corrosion
 The positive grid is held at the charging voltage, immersed in sulfuric acid, and will corrode throughout the life of the battery when the top-of-charge is reached.

4.1. Non-battery energy storage
 Pumped Hydroelectric Storage (PHS) is widely used for electrical energy storage (EES) and has the largest installed capacity, [3].
