

What are the types of capacitors according to their shapes

Overview

A capacitor consists of two metal plates and an insulating material known as a dielectric. Depending on the type of dielectric material and the construction, various types of capacitors are available in the market. Note: Capacitors differ in size and characteristics. For example, some capacitors, such as those used in. Their capacitance value is fixed during manufacturing and cannot be changed later. They are divided into two types: 1. Polarized 2. Non-polarized A variable capacitor is a capacitor whose capacitance may be varied manually or electrically. In general, variable capacitors are made up of two sets of intertwined metallic plates, one of which is fixed and the other variable. These. A ceramic capacitor is a non-polarized fixed capacitor made out of two or more alternating layers of ceramic and metal in which the ceramic material acts as the dielectric and the metal acts as the electrodes. The ceramic material is a mixture of finely ground granules of or materials, modified by mixed that are necessary to achieve the capacitor's desired character.
