

# What auxiliary device should be used for solar photovoltaic

## Overview

Photovoltaic systems are continually evolving to improve their efficiency and financial viability. One trend is to move to larger strings of cells giving higher dc voltages to be converted to ac voltage for the grid. Cost savings result but auxiliary power supplies for monitoring and control need to accept these higher. Photovoltaic (PV) power generation systems have always fought to justify themselves in terms of \$/watt of generated power and are hampered by the initial low efficiency of the panels themselves. Currently, levels of. However, there is an area in the system that requires attention; PV combiners and inverters need low voltage isolated power for monitoring and control. Fortunately, there are ready-made solutions available on the market to address these design challenges. Dc-dc converters like CUI's AE Series are specifically designed for 1,500-Vdc photovoltaic systems.
