

Which controller to choose for monocrystalline solar panels

Overview

The charge controller in your solar installation sits between the energy source (solar panels) and storage (batteries). Charge controllers prevent your batteries from being overcharged by limiting the amount and rate. Regarding “what does a solar charge controller do”, most charge controllers have a charge current passing through a semiconductor which acts like a valve to control the current. Typically, yes. You don't need a charge controller with small 1 to 5 watt panels that you might use to charge a mobile device or to power a single light. If a panel puts out 2 watts or less for. There are two main types of charge controllers to consider: the cheaper, but less efficient Pulse Width Modulation (PWM) charge controllers and the highly efficient Maximum Power Point Tracking (MPPT) charge controllers. When it comes to charge controller sizing, you have to take into consideration whether you're using a PWM or MPPT controller. An improperly selected charge controller may result in up to a 5% loss in efficiency.
